4

SECURE SOCKETS LAYER
(SSL)

- ❖ layered on top of TCP
- ❖ SSL versions 1.0, 2.0, 3.0, 3.1
- ❖ Netscape protocol
- ❖ later refitted as IETF standard TLS (Transport Layer Security)
- ❖ TLS 1.0 very close to SSL 3.1

© Ravi Sandhu 2002

2

SSL ARCHITECTURE

- ❖ Handshake protocol: complicated
 - > embodies key exchange & authentication
 - > 10 message types
- ❖ Record protocol: straightforward
 - > fragment, compress, MAC, encrypt
- ❖ Change Cipher Spec protocol: straightforward
 - > single 1 byte message with value 1
 - > could be considered part of handshake protocol
- ❖ Alert protocol: straightforward
 - > 2 byte messages
 - 1 byte alert level- fatal or warning; 1 byte alert code

© Ravi Sandhu 2002

5

SECURE SOCKETS LAYER
(SSL)

- ❖ application protocol independent
- ❖ does not specify how application protocols add security with SSL
 - > how to initiate SSL handshaking
 - > how to interpret certificates
- ❖ left to designers of upper layer protocols to figure out

© Ravi Sandhu 2002

3

SSL/TLS DIFFERENCES

- ❖ TLS uses HMAC, SSL uses a precursor
- ❖ TLS MAC covers compression version field in addition to what SSL MAC covers
- ❖ TLS defines additional alert codes
- ❖ other minor differences
- ❖ TLS has a mode to fall back to SSL

© Ravi Sandhu 2002

6

SSL SERVICES

- ❖ peer entity authentication
- ❖ data confidentiality
- ❖ data authentication and integrity
- ❖ compression/decompression
- ❖ generation/distribution of session keys
 - integrated into protocol
- ❖ security parameter negotiation

© Ravi Sandhu 2002

7

SSL CONNECTION STATE

- ❖ connection end: client or server
- ❖ client and server random: 32 bytes each
- ❖ keys generated from master secret, client/server random
 - client_write_MAC_secret server_write_MAC_secret
 - client_write_key server_write_key
 - client_write_IV server_write_IV
- ❖ compression state
- ❖ cipher state: initially IV, subsequently next feedback block
- ❖ sequence number: starts at 0, max $2^{64}-1$

© Ravi Sandhu 2002

10

SSL SESSIONS AND CONNECTIONS

- ❖ Every connection is associated with one session
- ❖ Session can be reused across multiple secure connections
- ❖ Handshake protocol
 - establishes new session and connection together
 - uses existing session for new connection

© Ravi Sandhu 2002

8

SSL CONNECTION STATE

- ❖ 4 parts to state
 - current read state
 - current write state
 - pending read state
 - pending write state
- ❖ handshake protocol
 - initially current state is empty
 - either pending state can be made current and reinitialized to empty

© Ravi Sandhu 2002

11

SSL SESSION

- ❖ SSL session negotiated by handshake protocol
 - session ID
 - chosen by server
 - X.509 public-key certificate of peer
 - possibly null
 - compression algorithm
 - cipher spec
 - encryption algorithm
 - message digest algorithm
 - master secret
 - 48 byte shared secret
 - is resumable flag
 - can be used to initiate new connections

© Ravi Sandhu 2002

9

SSL RECORD PROTOCOL

- ❖ 4 steps by sender (reversed by receiver)
 - Fragmentation
 - Compression
 - MAC
 - Encryption

© Ravi Sandhu 2002

12

SSL RECORD PROTOCOL

- ❖ each SSL record contains
 - content type: 8 bits, only 4 defined
 - change_cipher_spec
 - alert
 - handshake
 - application_data
 - protocol version number: 8 bits major, 8 bits minor
 - length: max 16K bytes (actually $2^{14}+2048$)
 - data payload: optionally compressed and encrypted
 - message authentication code (MAC)

© Ravi Sandhu 2002

13

SSL HANDSHAKE PROTOCOL

Fig. 1 - Message flow for a full handshake
* Indicates optional or situation-dependent messages that are not always sent.

© Ravi Sandhu 2002

16

SSL HANDSHAKE PROTOCOL

- ❖ initially SSL session has null compression and cipher algorithms
- ❖ both are set by the handshake protocol at beginning of session
- ❖ handshake protocol may be repeated during the session

© Ravi Sandhu 2002

14

SSL HANDSHAKE PROTOCOL

Fig. 1 - Message flow for a full handshake
* Indicates optional or situation-dependent messages that are not always sent.

© Ravi Sandhu 2002

17

SSL HANDSHAKE PROTOCOL

- ❖ Type: 1 byte
 - 10 message types defined
- ❖ length: 3 bytes
- ❖ content

© Ravi Sandhu 2002

15

SSL HANDSHAKE PROTOCOL

- ❖ Phase 1:
 - Establish security capabilities
- ❖ Phase 2:
 - Server authentication and key exchange
- ❖ Phase 3:
 - Client authentication and key exchange
- ❖ Phase 4:
 - Finish

© Ravi Sandhu 2002

18

SSL 1-WAY HANDSHAKE WITH RSA

Fig. 1 - Message flow for a full handshake
* Indicates optional or situation-dependent messages that are not always sent.

SSL HANDSHAKE PROTOCOL

Fig. 2 - Message flow for an abbreviated handshake

SSL 2-WAY HANDSHAKE WITH RSA

Fig. 1 - Message flow for a full handshake
* Indicates optional or situation-dependent messages that are not always sent.

SSL HANDSHAKE PROTOCOL

- ❖ **hello_request (not shown) can be sent anytime from server to client to request client to start handshake protocol to renegotiate session when convenient**
- ❖ **can be ignored by client**
 - if already negotiating a session
 - don't want to renegotiate a session
 - client may respond with a `no_renegotiation_alert`

SSL HANDSHAKE PROTOCOL

- ❖ **these 9 handshake messages must occur in order shown**
- ❖ **optional messages can be eliminated**
- ❖ **10th message explained later**
 - `hello_request` message
- ❖ **change_cipher_spec is a separate 1 message protocol**
 - functionally it is just like a message in the handshake protocol

SSL HANDSHAKE PROTOCOL

Fig. 1 - Message flow for a full handshake
* Indicates optional or situation-dependent messages that are not always sent.

SSL HANDSHAKE: PHASE 1 ESTABLISH SECURITY CAPABILITIES

- ❖ **client hello**
 - > 4 byte timestamp, 28 byte random value
 - > **session ID:**
 - non-zero for new connection on existing session
 - zero for new connection on new session
 - > **client version:** highest version
 - > **cipher_suite list:** ordered list
 - > **compression list:** ordered list

© Ravi Sandhu 2002

25

SSL HANDSHAKE: PHASE 1 ESTABLISH SECURITY CAPABILITIES

- ❖ **cipher suite**
 - > **cipher spec**
 - CipherAlgorithm: RC4, RC2, DES, 3DES, DES40, IDEA, Fortezza
 - MACAlgorithm: MD5 or SHA-1
 - CipherType: stream or block
 - IsExportable: true or false
 - HashSize: 0, 16 or 20 bytes
 - Key Material: used to generate write keys
 - IV Size: size of IV for CBC

© Ravi Sandhu 2002

28

SSL HANDSHAKE: PHASE 1 ESTABLISH SECURITY CAPABILITIES

- ❖ **server hello**
 - > 32 byte random value
 - > **session ID:**
 - new or reuse
 - > **version**
 - lower of client suggested and highest supported
 - > **cipher_suite list:** single choice
 - > **compression list:** single choice

© Ravi Sandhu 2002

26

SSL HANDSHAKE PROTOCOL

Fig. 1 - Message flow for a full handshake
* Indicates optional or situation-dependent messages that are not always sent.

© Ravi Sandhu 2002

29

SSL HANDSHAKE: PHASE 1 ESTABLISH SECURITY CAPABILITIES

- ❖ **cipher suite**
 - > **key exchange method**
 - RSA: requires receiver's public-key certificates
 - Fixed DH: requires both sides to have public-key certificates
 - Ephemeral DH: signed ephemeral keys are exchanged, need signature keys and public-key certificates on both sides
 - Anonymous DH: no authentication of DH keys, susceptible to man-in-the-middle attack
 - Fortezza: Fortezza key exchange we will ignore Fortezza from here on

© Ravi Sandhu 2002

27

SSL HANDSHAKE: PHASE 2 SERVER AUTHENTICATION & KEY EXCHANGE

- ❖ **Certificate message**
 - > server's X.509v3 certificate followed by optional chain of certificates
 - > required for RSA, Fixed DH, Ephemeral DH but not for Anonymous DH
- ❖ **Server Key Exchange message**
 - > not needed for RSA, Fixed DH
 - > needed for Anonymous DH, Ephemeral DH
 - > needed for RSA where server has signature-only key
 - server sends temporary RSA public encryption key to client

© Ravi Sandhu 2002

30

SSL HANDSHAKE: PHASE 2 SERVER AUTHENTICATION & KEY EXCHANGE

- ❖ **Server Key Exchange message**
 - signed by the server
 - signature is on hash of
 - ClientHello.random, ServerHello.random
 - Server Key Exchange parameters
- ❖ **Certificate Request message**
 - request a certificate from client
 - specifies Certificate Type and Certificate Authorities
 - certificate type specifies public-key algorithm and use
- ❖ **Server Done message**
 - ends phase 2, always required

© Ravi Sandhu 2002

31

SSL HANDSHAKE: PHASE 3 CLIENT AUTHENTICATION & KEY EXCHANGE

- ❖ **Client Key Exchange message**
 - **RSA**
 - client generates 48-byte pre-master secret, encrypts with server's RSA public key (from server certificate or temporary key from Server Key Exchange message)
 - **Ephemeral or Anonymous DH**
 - client's public DH value
 - **Fixed DH**
 - null, public key previously sent in Certificate Message

© Ravi Sandhu 2002

34

SSL HANDSHAKE PROTOCOL

Fig. 1 - Message flow for a full handshake
* Indicates optional or situation-dependent messages that are not always sent.

© Ravi Sandhu 2002

32

SSL HANDSHAKE: POST PHASE 3 CRYPTOGRAPHIC COMPUTATION

- ❖ **48 byte pre master secret**
 - **RSA**
 - generated by client
 - sent encrypted to server
 - **DH**
 - both sides compute the same value
 - each side uses its own private value and the other sides public value

© Ravi Sandhu 2002

35

SSL HANDSHAKE: PHASE 3 CLIENT AUTHENTICATION & KEY EXCHANGE

- ❖ **Certificate message**
 - send if server has requested certificate and client has appropriate certificate
 - otherwise send no_certificate alert
- ❖ **Client Key Exchange message**
 - content depends on type of key exchange (see next slide)
- ❖ **Certificate Verify message**
 - can be optionally sent following a client certificate with signing capability
 - signs hash of master secret (established by key exchange) and all handshake messages so far
 - provides evidence of possessing private key corresponding to certificate

© Ravi Sandhu 2002

33

SSL HANDSHAKE: POST PHASE 3 CRYPTOGRAPHIC COMPUTATION

```
master_secret = PRF(pre_master_secret, "master secret",
                  ClientHello.random + ServerHello.random)
[0..47];

pre_master_secret: 48 bytes
```

PRF is composed of a sequence and nesting of HMACs

© Ravi Sandhu 2002

36

SSL HANDSHAKE PROTOCOL

Record Protocol

Fig. 1 - Message flow for a full handshake

* Indicates optional or situation-dependent messages that are not always sent.

© Ravi Sandhu 2002

37

SSL HANDSHAKE: PHASE 4 FINISH

Finished message

verify_data
PRF(master_secret, finished_label, MD5(handshake_messages)+SHA-1(handshake_messages)) [0..11];

finished_label
For Finished messages sent by the client, the string "client finished". For Finished messages sent by the server, the string "server finished".

handshake_messages
All of the data from all handshake messages up to but not including this message. This is only data visible at the handshake layer and does not include record layer headers.

© Ravi Sandhu 2002

40

SSL HANDSHAKE: PHASE 4 FINISH

- ❖ **Change Cipher Spec message**
 - not considered part of handshake protocol but in some sense is part of it
- ❖ **Finished message**
 - sent under new algorithms and keys
 - content is hash of all previous messages and master secret

© Ravi Sandhu 2002

38

SSL ALERT PROTOCOL

- ❖ **2 byte alert messages**
 - **1 byte level**
 - fatal or warning
 - **1 byte**
 - alert code

© Ravi Sandhu 2002

41

SSL HANDSHAKE: PHASE 4 FINISH

- ❖ **Change Cipher Spec message**
 - 1 byte message protected by current state
 - copies pending state to current state
 - sender copies write pending state to write current state
 - receiver copies read pending state to read current state
 - immediately send finished message under new current state

© Ravi Sandhu 2002

39

SSL ALERT MESSAGES

Warning or fatal

```
close_notify(0),
unexpected_message(10),
bad_record_mac(20),
decryption_failed(21),
record_overflow(22),
decompression_failure(30),
handshake_failure(40),
bad_certificate(42),
unsupported_certificate(43),
certificate_revoked(44),
certificate_expired(45),
certificate_unknown(46),
illegal_parameter(47),
unknown_ca(48),
access_denied(49),
decode_error(50),
decrypt_error(51),
export_restriction(60),
protocol_version(70),
insufficient_security(71),
internal_error(80),
user_canceled(90),
no_renegotiation(100),
```

© Ravi Sandhu 2002

42

SSL ALERT MESSAGES

- ❖ **always fatal**
 - > **unexpected_message**
 - > **bad_record_mac**
 - > **decompression_failure**
 - > **handshake_failure**
 - > **illegal_parameter**

APPLICATIONS AND SSL

- ❖ **use dedicated port numbers for every application that uses SSL**
 - > **de facto what is happening**
- ❖ **use normal application port and negotiate security options as part of application protocol**
- ❖ **negotiate use of SSL during normal TCP/IP connection establishment**

APPLICATION PORTS OFFICIAL AND UNOFFICIAL

- | | | | |
|----------------|------------|-------------------|------------|
| ❖ https | 443 | ❖ ftp-data | 889 |
| ❖ ssmtp | 465 | ❖ ftps | 990 |
| ❖ snntp | 563 | ❖ imaps | 991 |
| ❖ sldap | 636 | ❖ telnets | 992 |
| ❖ spop3 | 995 | ❖ ircs | 993 |
