INFS 766 Internet Security Protocols

Lecture 9 Kerberos

Prof. Ravi Sandhu

PHYSICAL SECURITY

CLIENT WORKSTATIONS

> None, so cannot be trusted

* SERVERS

Moderately secure rooms, with moderately diligent system administration

*** KERBEROS**

Highly secure room, with extremely diligent system administration

4

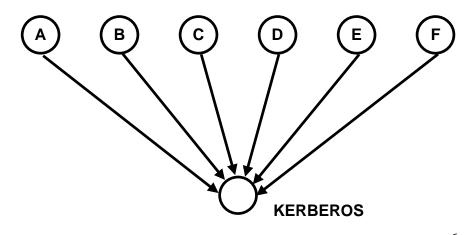

KERBEROS OBJECTIVES

- provide authentication between any pair of entities
- primarily used to authenticate user-atworkstation to server
- in general, can be used to authenticate two or more secure hosts to each other on an insecure network
- servers can build authorization and access control services on top of Kerberos

TRUST: BILATERAL RHOSTS MODEL

TRUST: CONSOLIDATED KERBEROS MODEL

© Ravi Sandhu 2000-2004

TRUST: CONSOLIDATED KERBEROS MODEL

- breaking into one host provides a cracker no advantage in breaking into other hosts
- authentication systems can be viewed as trust propagation systems
 - > the Kerberos model is a centralized star model

7

> the rhosts model is a tangled web model

© Ravi Sandhu 2000-2004

WHAT KERBEROS DOES NOT DO

- makes no sense on an isolated system
- does not mean that host security can be allowed to slip
- does not protect against Trojan horses
- does not protect against viruses/worms

KERBEROS DESIGN GOALS

* IMPECCABILITY

- > no cleartext passwords on the network
- no client passwords on servers (server must store secret server key)
- minimum exposure of client key on workstation (smartcard solution would eliminate this need)

* CONTAINMENT

- > compromise affects only one client (or server)
- > limited authentication lifetime (8 hours, 24 hours, more)

* TRANSPARENCY

- > password required only at login
- > minimum modification to existing applications

© Ravi Sandhu 2000-2004 9

KERBEROS DESIGN DECISIONS

- Uses timestamps to avoid replay.
 Requires time synchronized within a small window (5 minutes)
- Uses DES-based symmetric key cryptography
- * stateless

KERBEROS VERSIONS

- We describe Kerberos version 4 as the base version
- Kerberos version 5 fixes many shortcomings of version 4, and is described here by explaining major differences with respect to version 4

11

NOTATION

c client principal

s server principal

K_x secret key of "x" (known to x and Kerberos)

K_{c,s} session key for "c" and "s" (generated by Kerberos and distributed to c and s)

 $\{P\}K_q$ P encrypted with K_q

T_{c,s} ticket for "c" to use "s"(given by Kerberos to c and verified by s)

A_{c,s} authenticator for "c" to use "s" (generated

by c and verified by s)

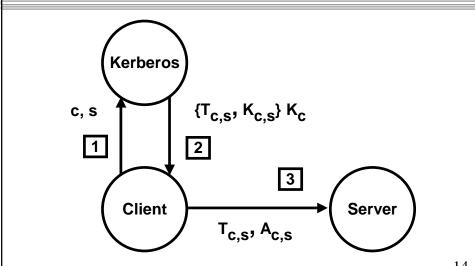

TICKETS AND AUTHENTICATORS

- $T_{c,s} = \{s, c, addr, time_o, life, K_{c,s}\}K_s$
- $A_{c,s} = \{c, addr, time_a\} K_{c,s}$
- is the IP address, adds little * addr removed in version 5

© Ravi Sandhu 2000-2004

13

SESSION KEY DISTRIBUTION

© Ravi Sandhu 2000-2004

USER AUTHENTICATION

* for user to server authentication, client key is the user's password (converted to a DES key via a publicly known algorithm)

© Ravi Sandhu 2000-2004

15

TRUST IN WORKSTATION

- untrusted client workstation has K_c
- is expected to delete it after decrypting message in step 2
- compromised workstation can compromise one user
- compromise does not propagate to other users

AUTHENTICATION FAILURES

- Ticket decryption by server yields garbage
- Ticket timed out
- Wrong source IP address
- Replay attempt

© Ravi Sandhu 2000-2004

17

KERBEROS IMPERSONATION

- active intruder on the network can cause denial of service by impersonation of Kerberos IP address
- network monitoring at multiple points can help detect such an attack by observing IP impersonation

KERBEROS RELIABILITY

- availability enhanced by keeping slave Kerberos servers with replicas of the Kerberos database
- * slave databases are read only
- simple propagation of updates from master to slaves

© Ravi Sandhu 2000-2004

19

USE OF THE SESSION KEY

- ❖ Kerberos establishes a session key K_{c.s}
- session key can be used by the applications for
 - client to server authentication (no additional step required in the protocol)
 - mutual authentication (requires fourth message from server to client {f(A_{c,s})}K_{c,s}, where f is some publicly known function)
 - > message confidentiality using K_{c,s}
 - > message integrity using K_{c,s}

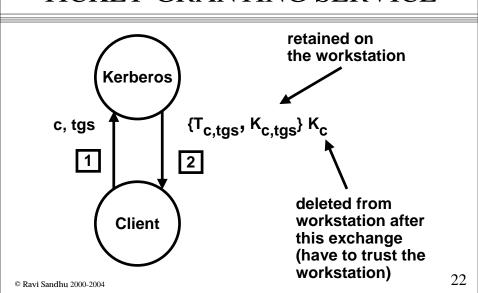

TICKET-GRANTING SERVICE

Problem: Transparency

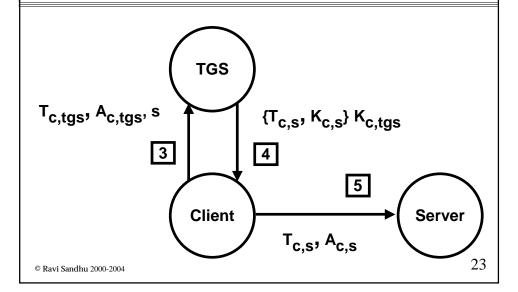

- user should provide password once upon initial login, and should not be asked for it on every service request
- workstation should not store the password, except for the brief initial login
- Solution: Ticket-Granting Service (TGS)
 - store session key on workstation in lieu of password
 - TGS runs on same host as Kerberos (needs access to K_c and K_s keys)

© Ravi Sandhu 2000-2004 21

TICKET-GRANTING SERVICE

TICKET-GRANTING SERVICE

TICKET LIFETIME

- * Life time is minimum of:
 - > requested life time
 - > max lifetime for requesting principal
 - > max lifetime for requesting service
 - > max lifetime of ticket granting ticket
- * Max lifetime is 21.5 hours

NAMING

- Users and servers have same name format:
 - > name.instance@realm
- * Example:
 - > sandhu@isse.gmu.edu
 - > sandhu.root@isse.gmu.edu
 - > rcmd.ipc4@isse.gmu.edu
 - > rcmd.csis@isse.gmu.edu
- Mapping of Kerberos authentication names to local system names is left up to service provider

© Ravi Sandhu 2000-2004 25

KERBEROS V5 ENHANCEMENTS

- Naming
 - Kerberos V5 supports V4 names, but also provides for other naming structures such as X.500 and DCE
- Timestamps
 - > V4 timestamps are Unix timestamps (seconds since 1/1/1970). V5 timestamps are in OSI ASN.1 format.
- Ticket lifetime
 - > V4 tickets valid from time of issue to expiry time, and limited to 21.5 hours.
 - > V5 tickets have start and end timestamps. Maximum lifetime can be set by realm.

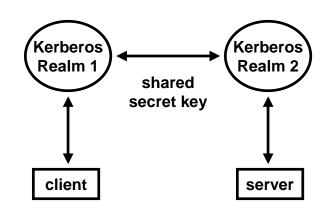

KERBEROS V5 ENHANCEMENTS

- Kerberos V5 tickets are renewable, so service can be maintained beyond maximum ticket lifetime.
- Ticket can be renewed until min of:
 - > requested end time
 - start time + requesting principal's max renewable lifetime
 - > start time + requested server's max renewable lifetime
 - > start time + max renewable lifetime of realm

© Ravi Sandhu 2000-2004

27

KERBEROS INTER-REALM AUTHENTICATION

© Ravi Sandhu 2000-2004

KERBEROS INTER-REALM AUTHENTICATION

- Kerberos V4 limits inter-realm interaction to realms which have established a shared secret key
- Kerberos V5 allows longer paths
- For scalability one may need publickey technology for inter-realm interaction

© Ravi Sandhu 2000-2004

29

KERBEROS DICTIONARY ATTACK

- First two messages reveal knownplaintext for dictionary attack
- * first message can be sent by anyone
- Kerberos v5 has pre-authentication option to prevent this attack

© Ravi Sandhu 2000-2004
